

# Fixed Menu Plugin

---

## HOW TO SET UP

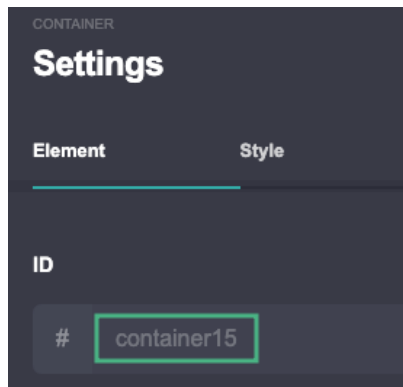

---

1. Paste the code from .txt file into your Fixed Navigation Embed element, before the `</style>` tag.

### Code

```
<style>
#container14,
#container06{
top: 0;
z-index: 10;
}
//paste here
</style>
```

2. Identify your Menu container IDs.

3. Replace the placeholders with your Menu container IDs. You can have multiple menus for different categories as needed.

```
Code

<style>
#container14,
#container06{
top: 0;
z-index: 10;
}
#container13,
#container15,
#container10{
z-index: 9;
display: none;
overflow: auto;
align-items: flex-start;
position: absolute !important;
}
</style>
```

- If the desktop and mobile versions share the same menu, you can remove any unnecessary items and keep only the ones you need. Example:

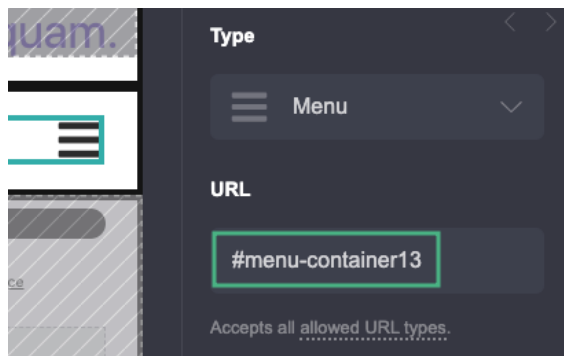

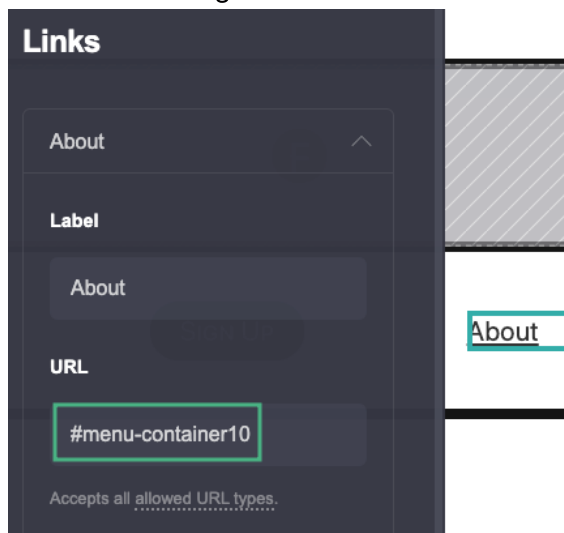

```
#container13{
  z-index: 9;
  display: none;
  overflow: auto;
  align-items: flex-start;
  position: absolute !important;
}
```

4. Ensure that all your Menu containers are placed **before the Header End** breakpoint.

## menu 3

5. In the navigation link's URL area, enter the corresponding Menu container ID with the prefix **#menu-**, as shown in the images.

- You can use the same method to edit links in the menu so that they open another menu.
